Abstract - In this paper we have established some indefinite integrals involving certain polynomials in the form of Hypergeometric function. The results represent here are assume to be new.

Key Words: Hypergeometric function, Lucas Polynomials, Gegenbaur Polynomials, Harmonic number, Bernoulli Polynomials, and Hermite Polynomials.

1. Introduction

The special function is one of the central branches of Mathematical sciences initiated by L'Euler. But systematic study of the Hypergeometric functions were initiated by C.F Gauss, an eminent German Mathematician in 1812 by defining the Hypergeometric series and he had also proposed notation for Hypergeometric functions. Since about 250 years several talented brains and promising Scholars have been contributed to this area. Some of them are C.F Gauss, G.H Hardy, S. Ramanujan, A.P Prudnikov, W.W Bell, Yu. A Brychkov and G.E Andrews.

We have the generalized Gaussian hypergeometric function of one variable

\[ _{A}F_{B} (a_1, a_2, ..., a_A; b_1, b_2, ..., b_B; z) = \sum_{k=0}^{\infty} \frac{(a_1)_k (a_2)_k ... (a_A)_k z^k}{(b_1)_k (b_2)_k ... (b_B)_k k!} \]  

(1)

where the parameters \( b_1, b_2, ..., b_B \) are neither zero nor negative integers and \( A, B \) are non negative integers.

The series converges for all finite \( z \) if \( A \leq B \), converges for \( |z| < 1 \) if \( A = B + 1 \), diverges for all \( z \), \( z \neq 0 \) if \( A > B + 1 \).

Lucas Polynomials

The Lucas polynomials are the \( w \)-polynomials obtained by setting \( p(x) = x \) and \( q(x) = 1 \) in the Lucas polynomials sequence. It is given explicitly by

\[ L_n(x) = 2^{-n} \left( (x - \sqrt{x^2 + 4})^n + (x + \sqrt{x^2 + 4})^n \right) \]  

(2)

The first few are

\[
\begin{align*}
L_1(x) &= x \\
L_2(x) &= x^2 + 2 \\
L_3(x) &= x^3 + 3x \\
L_4(x) &= x^4 + 4x^2 + 2
\end{align*}
\]  

(3)

Generalized Harmonic Number
The generalized harmonic number of order \( n \) of \( m \) is given by

\[
H^{(m)}_n = \sum_{k=1}^{n} \frac{1}{k^m}
\]  

(4)

In the limit of \( n \to \infty \), the generalized harmonic number converges to the Riemann zeta function

\[
\lim_{n \to \infty} H^{(m)}_n = \zeta(m)
\]  

(5)

**Bernoulli Polynomial**

The explicit formula of Bernoulli polynomials is

\[
B_n(x) = \sum_{k=0}^{n} \frac{n!}{k!(n-k)!} b_k x^{n-k}, \text{ for } n \geq 0,
\]

where \( b_k \) are the Bernoulli numbers.

The generating function for the Bernoulli polynomials is

\[
\frac{te^{xt}}{e^t - 1} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}
\]  

(6)

**Gegenbauer polynomials**

In Mathematics, Gegenbauer polynomials or ultraspherical polynomials are orthogonal polynomials on the interval \([-1,1]\) with respect to the weight function

\[
(1-x^2)^{\alpha-\frac{1}{2}}. \text{ They generalize Legendre polynomials and Chebyshev polynomials, and are special cases of Jacobi polynomials. They are named after Leopold Gegenbauer.}
\]

Explicitly,

\[
C_n^{(\alpha)}(x) = \frac{1}{\Gamma(\alpha)(n-2k)!} \sum_{k=0}^{\left\lfloor \frac{n}{2} \right\rfloor} (-1)^k \frac{\Gamma(n-k+\alpha)}{\Gamma(\alpha)k!(n-2k)!} (2x)^{(n-2k)}
\]  

(7)

**Laguerre polynomials**

The Laguerre polynomials are solutions \( L_n(x) \) to the Laguerre differential equation

\[
xy'' + (1-x)y' + \lambda y = 0,
\]

which is a special case of the more general associated Laguerre differential equation, defined by
\( xy'' + (v + 1 - x)y' + \lambda y = 0 \), where \( \lambda \) and \( v \) are real numbers with \( v \neq 0 \).

The Laguerre polynomials are given by the sum

\[
L_n(x) = \sum_{k=0}^{n} \frac{(-1)^k}{k!} \frac{n!}{(n-k)!} x^k
\]

**Hermite polynomials**

The Hermite polynomials \( H_n(x) \) are set of orthogonal polynomials over the domain \((-\infty, \infty)\) with weighting function \( e^{-x^2} \).

The Hermite polynomials \( H_n(x) \) can be defined by the contour integral

\[
H_n(z) = \frac{n!}{2\pi i} \oint e^{-t^2 + 2izt} t^{-n-1} dt,
\]

where the contour incloses the origin and is traversed in a counterclockwise direction (Arfken 1985, p. 416).

The first few Hermite polynomials are

\[
\begin{align*}
H_0(x) &= 1 \\
H_1(x) &= 2x \\
H_2(x) &= 4x^2 - 2 \\
H_3(x) &= 8x^3 - 12x \\
H_4(x) &= 16x^4 - 48x^2 + 12
\end{align*}
\]

**Legendre function of the first kind**

The Legendre polynomials, sometimes called Legendre functions of the first kind, Legendre coefficients, or zonal harmonics (Whittaker and Watson 1990, p. 302), are solutions to the Legendre differential equation. If \( l \) is an integer, they are polynomials. The Legendre polynomials \( P_n(x) \) are illustrated above for \( x \in [-1, 1] \) and \( n = 1, 2, ..., 5 \).

The Legendre polynomials \( P_n(x) \) can be defined by the contour integral

\[
P_n(z) = \frac{1}{2\pi i} \oint (1 - 2tz + t^2)^{-\frac{1}{2}} t^{-n-1} dt,
\]

where the contour encloses the origin and is traversed in a counterclockwise direction (Arfken 1985, p. 416).

**Legendre function of the second kind**

The second solution to the Legendre differential equation. The Legendre functions of the second kind...
satisfy the same recurrence relation as the Legendre polynomials.

The first few are

\[
Q_0(x) = \frac{1}{2} \ln\left(\frac{1+x}{1-x}\right) \\
Q_1(x) = \frac{x}{2} \ln\left(\frac{1+x}{1-x}\right) - 1 \\
Q_2(x) = \frac{3x^2 - 1}{4} \ln\left(\frac{1+x}{1-x}\right) - \frac{3x}{2}
\]

\[(11)\]

Chebyshev polynomial of the first kind

The Chebyshev polynomials of the first kind are defined through the identity

\[T_n(\cos \theta) = \cos n\theta.\]

Chebyshev polynomial of the second kind

A beautiful plot can be obtained by plotting \(T_n(x)\) radially, increasing the radius for each value of \(n\), and filling in the areas between the curves (Trott 1999, pp. 10 and 84).

The first few Chebyshev polynomials of the first kind are

\[T_0(x) = 1\]
\[T_1(x) = x\]
\[T_2(x) = 2x^2 - 1\]
\[T_3(x) = 4x^3 - 3x\]

The Chebyshev polynomials of the first kind are defined through the identity

\[T_n(\cos \theta) = \cos n\theta.\]
A modified set of Chebyshev polynomials defined by a slightly different generating function. They arise in the development of four-dimensional spherical harmonics in angular momentum theory. They are a special case of the Gegenbauer polynomial with $\alpha = 1$. They are also intimately connected with trigonometric multiple-angle formulas.

The first few Chebyshev polynomials of the second kind are

\[
\begin{align*}
U_0(x) &= 1 \\
U_1(x) &= 2x \\
U_2(x) &= 4x^2 - 1 \\
U_3(x) &= 8x^3 - 4x
\end{align*}
\]

Euler polynomial

The Euler polynomial $E_n(x)$ is given by the Appell sequence with

\[ g(t) = \frac{1}{2} (e^t + 1), \]

giving the generating function

\[
\frac{2e^{xt}}{e^t + 1} = \sum_{n=0}^{\infty} E_n(x) \frac{t^n}{n!} .
\]

The first few Euler polynomials are

\[
\begin{align*}
E_0(x) &= 1 \\
E_1(x) &= x - \frac{1}{2} \\
E_2(x) &= x^2 - x \\
E_3(x) &= x^3 - \frac{3}{2} x^2 + \frac{1}{4}
\end{align*}
\]

Generalized Riemann zeta function

The Riemann zeta function is an extremely important special function of mathematics and physics that arises in definite integration and is intimately related with very deep results surrounding the prime number theorem. While many of the properties of this function have been investigated, there remain important fundamental conjectures (most notably the Riemann hypothesis) that remain unproved to this day. The Riemann zeta function $\zeta(s)$ is defined over the complex
plane for one complex variable, which is conventionally denoted $s$ (instead of the usual $z$) in deference to the notation used by Riemann in his 1859 paper that founded the study of this function (Riemann 1859).

The plot above shows the “ridges” of $|\zeta(x + iy)|$ for $0 < x < 1$ and $1 < y < 100$. The fact that the ridges appear to decrease monotonically for $0 \leq x \leq 1/2$ is not a coincidence since it turns out that monotonic decrease implies the Riemann hypothesis (Zvengrowski and Saidak 2003; Borwein and Bailey 2003, pp. 95-96).

On the real line with $x > 1$, the Riemann zeta function can be defined by the integral

$$\zeta(x) \equiv \frac{1}{\Gamma(x)} \int_0^\infty \frac{u^{x-1}}{e^u - 1} du,$$

where $\Gamma(x)$ is the gamma function.

### Complex infinity

Complex infinity is an infinite number in the complex plane whose complex argument is unknown or undefined. Complex infinity may be returned by Mathematica, where it is represented symbolically by ComplexInfinity. The Wolfram Functions Site uses the notation $\infty$ to represent complex infinity.

#### 2. MAIN RESULTS

$$\int L_1(x)(1+e^{-x})^\frac{1}{n} dx = n(e^{-x} + 1) \left( \begin{array}{c} 0 \frac{1}{n} \end{array} \frac{1}{n} \right) [x^\frac{1}{2} F_1(-\frac{1}{n}, -\frac{1}{n}; -e^{-x})] + C \quad (17)$$

Here $L_1(x)$ is Lucas Polynomials.

$$\int H^{(x)}_1 \sin^\frac{n}{x} (x) dx = -\cos(x) \sin^\frac{n+1}{2} (x) \sin^2(x)^\frac{1}{2} \sin^\frac{n-1}{2} (x) \sin^\frac{3}{2} (x) + C \quad (18)$$

Here $H^{(x)}_1$ is Generalized Harmonic number.

$$\int \zeta(1, x) \sin^\frac{n}{x} (x) dx = \infty + C \quad (19)$$

Here $\zeta(x)$ is Generalized Riemann zeta function.
\[
\int H_n(x) \sin^n(x) dx = \sin^{n-1}(x) \left\{ \frac{2x \cos(x)}{n+1} \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{n}; \sin^2(x)\right) \right] \right\} + C 
\]
(20)

Here \( H_n(x) \) is Hermite polynomials.

\[
\int U_n(x) \sin^n(x) dx = \sin^{n-1}(x) \left\{ \frac{2x \cos(x)}{n+1} \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{n}; \sin^2(x)\right) \right] \right\} + C 
\]
(21)

Here \( U_n(x) \) is Chebyshev polynomial of the second kind.

\[
\int T_n(x) \sin^n(x) dx = \frac{1}{2} \sin^{n-1}(x) \left\{ \frac{2x \cos(x)}{n+1} \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{n}; \sin^2(x)\right) \right] \right\} + C 
\]
(22)

Here \( T_n(x) \) is Chebyshev polynomial of the first kind.

\[
\int P_n(x) \sin^n(x) dx = \frac{1}{2} \sin^{n-1}(x) \left\{ \frac{2x \cos(x)}{n+1} \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{n}; \sin^2(x)\right) \right] \right\} + C 
\]
(23)

Here \( P_n(x) \) is Legendre function of the first kind.

\[
\int H_n(x) \sec^n(x) dx = \sin(x) \sin^2(x) \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{2}; \sin^2(x)\right) \right] + C 
\]
(24)

\[
\int H_n(x) \cos \sec^n(x) dx = - \cos(x) \sin^2(x) \left[ \frac{1}{2} F_2\left(1, \frac{1}{2}; \frac{3}{2}; \sin^2(x)\right) \right] + C 
\]
(25)
\[
\int F_1(x) \sin^n(x)dx = \frac{1}{2} \sin^{\frac{1}{n}+1}(x) \frac{2x \cos(x)}{2n+1} \left\{ _2F_1 \left( 1,1 + \frac{1}{2n} ; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

\[
-\sqrt{\pi} \frac{1}{n-1} \Gamma \left( 1 + \frac{1}{n} \right) \sin(x) \left\{ _3F_2 \left( 1,1 + \frac{1}{2n};1 + \frac{1}{2n}; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

\[
\int L_1(x) \sin^n(x)dx = \frac{1}{2} \sin^{\frac{1}{n}+1}(x) \frac{2x \cos(x)}{2n+1} \left\{ _2F_1 \left( 1,1 + \frac{1}{2n} ; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

\[
-\sqrt{\pi} \frac{1}{n-1} \Gamma \left( 1 + \frac{1}{n} \right) \sin(x) \left\{ _3F_2 \left( 1,1 + \frac{1}{2n};1 + \frac{1}{2n}; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

\[
\int C_1(x) \sin^n(x)dx = \frac{1}{2} \sin^{\frac{1}{n}+1}(x) \frac{2x \cos(x)}{2n+1} \left\{ _2F_1 \left( 1,1 + \frac{1}{2n} ; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

\[
-\sqrt{\pi} \frac{1}{n-1} \Gamma \left( 1 + \frac{1}{n} \right) \sin(x) \left\{ _3F_2 \left( 1,1 + \frac{1}{2n};1 + \frac{1}{2n}; \frac{3}{2} \left( 1 + \frac{1}{n} \right) ; \sin^2(x) \right) \right\} + C
\]

Here \( C_1(x) \) is \textit{Gegenbauer polynomials}.

\[
\int B_1(x) \cos^n(x)dx = \frac{1}{2} \cos^{\frac{1}{n}+1}(x) \left\{ \sqrt{\pi} \left( 2 \frac{1}{n} \right) \sin(x) \right\} \left\{ _2F_1 \left( 1,1 + \frac{1}{2n} ; \frac{3}{2} \left( 1 + \frac{1}{n} \right); \cos^2(x) \right) \right\} + C
\]

\[
\int \frac{\sin(x)}{2(1 + \frac{1}{n})\sqrt{\sin^2(x)}} \frac{\cos^{\frac{1}{n}+1}(x)}{2} \left\{ _2F_1 \left( \frac{1}{2}, \frac{1}{2} \left( 1 + \frac{1}{n}\right) ; \frac{1}{2} \left( 3 + \frac{1}{n} \right) ; \cos^2(x) \right) \right\} + C
\]

Here \( B_1(x) \) is \textit{Bernoulli Polynomial}.

\[
\int H_1^{(s)}(x) \cos^n(x)dx = \frac{\sin(x) \cos^{\frac{1}{n}+1}(x)}{(1 + \frac{1}{n})\sqrt{\sin^2(x)}} \left\{ _2F_1 \left( \frac{1}{2}, \frac{1}{2} \left( 1 + \frac{1}{n}\right) ; \frac{1}{2} \left( 3 + \frac{1}{n} \right) ; \cos^2(x) \right) \right\} + C
\]
\[
\int L_1(x) \sin^n(x) dx = -\frac{1}{2} \sin^n(x) [-\sqrt{\pi} \frac{1}{n+1} \Gamma(1+\frac{1}{n}) \sin(x)]
\]

* \[ _{\frac{n}{2}} F_2 \left(1, 1 + \frac{1}{2n}, 1 + \frac{1}{2n}; \frac{1}{2} (3 + \frac{1}{n}), 2 + \frac{1}{2n}; \sin^2(x) \right) \]

\[
+ 2 \cos(x) \sin^n(x) \frac{1}{2n} \frac{n-1}{2} F_1 \left(\frac{1}{2}, \frac{1}{2} \frac{n-1}{2}; \frac{3}{2}; \cos^2(x) \right)
\]

\[
+ \frac{2nx \cos(x)^2 F_1 \left(1, 1 + \frac{1}{2n}; \frac{1}{2} (3 + \frac{1}{n}); \sin^2(x) \right)}{n+1} \] + C
\]

\( (31) \)

Here \( L_1(x) \) is Laguerre polynomials.

\[
\int B_1(x) \cos ec^n(x) dx = \frac{1}{2} \cos ec^n(x) [\sqrt{\pi} (\frac{1}{n+1}) \Gamma(1-\frac{1}{n}) \sin(x)]
\]

* \[ _{\frac{n}{2}} F_2 \left(1, 1 - \frac{1}{2n}, 1 - \frac{1}{2n}; \frac{1}{2} (3 - \frac{1}{n}), 2 - \frac{1}{2n}; \sin^2(x) \right) \]

\[
+ \cos(x) \sin^2(x) \frac{1}{2n} \frac{1}{2} \frac{1}{n-1} F_1 \left(\frac{1}{2}, \frac{1}{2} (1 + \frac{1}{n}); \frac{3}{2}; \cos^2(x) \right)
\]

\[
+ \frac{2nx \cos(x)^2 F_1 \left(1, 1 - \frac{1}{2n}; \frac{1}{2} (3 - \frac{1}{n}); \sin^2(x) \right)}{n-1} \] + C
\]
