\*\*\*

**Abstract** - In this study seismic analysis is carried out on 3D RC frames with and without masonry infill wall and also considering soft storey for G+15 storey. The masonry infill (MI) is represented by equivalent diagonal strut. The results such as, static base shear, displacement and inter storey drift are obtained from the analysis. All the results are discussed and concluded.

**Key Words:** Base Shear, Inter Story Drift, Displacement...

## 1. INTRODUCTION

Reinforced concrete (RC) frames consist of horizontal elements (beams) and vertical elements (columns) connected by rigid joints. RC frames provide resistance to both gravity and lateral loads through bending in beams and columns. Reinforced concrete frame buildings often incorporate masonry infill panels as partitions within a building or as cladding to complete the building envelope. However, the properties and construction details of MI frames can have a significant influence on the overall behaviour of a structure.

RC frames with masonry infills are common in developing countries with regions of high seismicity. Masonry Infills (MI), which generally have high stiffness and strength, play a crucial role in reinforced concrete (RC) frame buildings during earthquakes but these are normally considered as non-structural elements and their stiffness contributions are generally ignored in practice, such an approach can lead to an unsafe design. The MI though constructed as secondary elements behaves as a constituent part of the structural system and determines the overall behaviour of the structure especially when it is subjected to seismic loads.

## 2. OBJECTIVES

- To evaluate the response of bare frame and infilled frames subjected to seismic loads as per IS 1893-2002 codal provisions.
- To perform seismic analysis using equivalent static method and response spectrum method.
- To study the response of regular and irregular building frames with and without infill walls.
- To compare the equivalent strut width using Hendry and Mainstone method.

- To compare the results obtained by storey displacement, inter storey drift, base shear.

## 3. METHODOLOGY

- Model has done for building frames with and without infill walls using ETABS.
- The design of 3D RC frame by considering dead load, live load and earthquake load is carried out for 15 storey building models.
- Calculation of width of equivalent diagonal strut for masonry infill by using Mainstone and Hendry formulae.
- The equivalent static analysis is carried out to obtain static base shear, storey displacement, Inter storey drift.
- The results obtained are tabulated, discussed and conclusions are drawn.

## 4. DESCRIPTION ABOUT THE MODEL

| Serial No. | Model name | Description   |
|------------|------------|---|
| 1          | M1         | Bare frame  |
| 3          | M2         | Frame with infill wall designed according to Mainstone.         |
| 3          | M3         | Frame with infill wall designed according to Hendry             |
| 4          | M4         | C shape bare frame  |
| 5          | M5         | C shape frame with infill wall designed according to Mainstone. |
| 6          | M6         | C shape frame with infill wall designed according to Hendry     |
| 7          | M7         | T shape bare frame  |
| 8          | M8         | T shape Frame with infill wall designed according to Mainstone. |
| 9          | M9         | T shape frame with infill wall designed according to Hendry     |
| 10         | M10        | Infill wall with soft storey designed according to Mainstone.   |
| 11         | M11        | Infill wall with soft storey designed according to Hendry       |

## 5. MODELLING

### 5.1 Following data is used in the analysis of the RC frame building models

#### Selection Of Building Parameters:

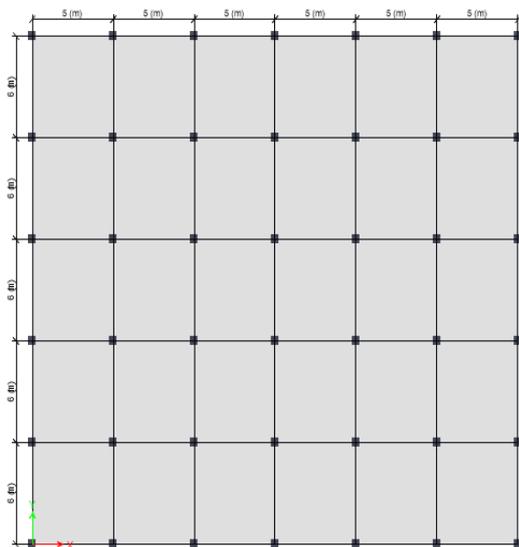

|                   |                                      |
|-------------------|--------------------------------------|
| Number of stories | G+15                                 |
| Storey height     | Ground floor -4m<br>Typical floor-3m |
| Column size       | 500mmx500mm                          |
| Beam size         | 230mmx450mm                          |
| Slab thickness    | 150mm                                |
| Wall thickness    | 230mm                                |

**Seismic details as per code IS 1893-2002:**

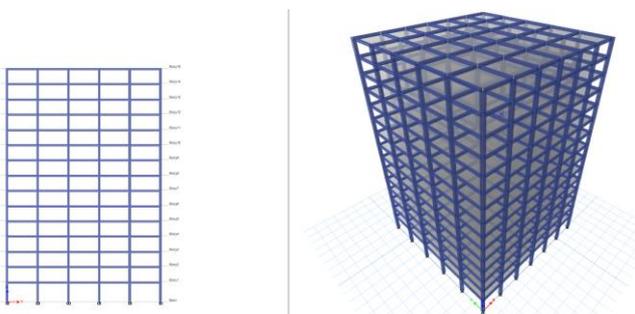

|                           |             |
|---------------------------|-------------|
| R (reduction factor) OMRF | 3           |
| I (importance factor)     | 1           |
| Z (zone factor) III       | 0.16        |
| Sa/g                      | Medium soil |

**Material properties :**

|                     |                        |
|---------------------|------------------------|
| Column              | M25                    |
| Beam                | M25                    |
| Slab                | M25                    |
| Density of concrete | 25kN/m <sup>3</sup>    |
| Density of masonry  | 21.2 kN/m <sup>3</sup> |

**Plan**

**3D view of G+15 without infill wall**

**5.2 Modelling of infill wall**

Equivalent Diagonal Strut Method is used for modelling the infill wall. In this method the infill wall is idealized as diagonal strut and the frame is modelled as beam or truss element. Frame analysis techniques are used for the elastic analysis. The idealization is based on the assumption that

there is no bond between frame and infill. The width of the diagonal strut is given as

1. Width of Equivalent diagonal strut according to Mainstone  
 $W = 0.16x d_{inf} x [\lambda H]^{-0.4}$

Where,  $\lambda$  is an empirical parameter expressing the relative stiffness of the column to the infill an is given by;

$$\lambda = \sqrt[4]{\frac{E_m t \sin 2\theta}{4 I_c E_c h}}$$

2. Calculation of diagonal strut width according to Hendry,

$$W = \frac{1}{2} \sqrt{ah^2 + al^2}$$

Where,

$$ah = \frac{\pi^4}{2} \sqrt{\frac{E_f I_c x h}{2 x E_m t x \sin 2\theta}}$$

$$al = \pi \sqrt{\frac{E_f I_b x l}{2 x E_m t x \sin 2\theta}}$$

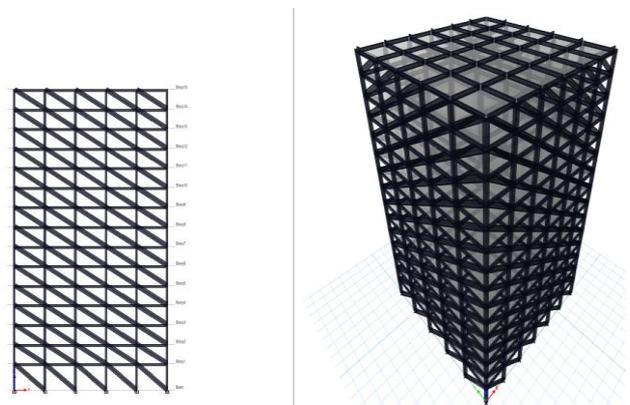

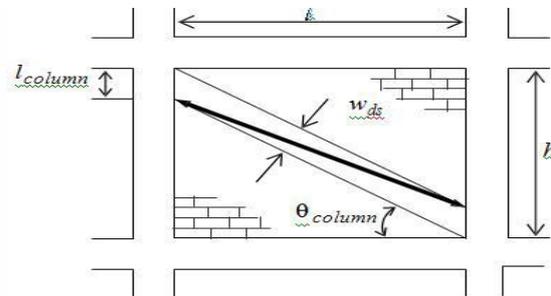

Where,

$E_m$  and  $E_f$  = Elastic modulus of the masonry wall and frame material (i.e., concrete), respectively

$L, h, t$  = Length, height and thickness of the infill wall, respectively

$I_c, I_b$  = Moment of inertia of column and the beam of structure, respectively

$\theta = \tan^{-1}(h / L)$  angle of inclination of diagonal strut.

## 6. RESULTS AND DISCUSSIONS

### 6.1 Base Shear

Base shear is maximum in case of infilled frame compared to bare frame. As observed from the results base shear is maximum in M3 model and minimum in M11 model. Base shear of M7 model has 60% less compared to M3 model, M8 model has 51% less, M4 and M9 models having 48% lesser base shear compare to M3 model, M5 has 42% less, M6 model has 38% less, M10 model has 3% less, M2 model has 2.5% less and M11 model has 1% less respectively.

### 6.2 Displacement

The displacements are maximum at top stories. The displacement of bare frame is more compared to infilled frames. The displacement is maximum in M1 model and minimum in M6 model. The displacement of M6 model is 86% less compared to M1 model, M5 model is 83% less, M9 is 80% less, M8 is 75% less, M3 is 71% less, M11 is 68% less, M2 is 64% less, M10 is 58% less, M4 is 38% less and M7 is 11% less respectively.

### 6.3 Inter Storey Drift

Inter storey drift is maximum in case of bare frame compare to other models except soft storey conditions. In soft storey condition, the storey drift is maximum at the soft storey level itself. The inter storey drift maximum in M1 model at storey-4 and minimum in M6 and M9 models at storey-6. Inter storey drift of M6 and M9 models at storey-6 are having 88% lesser compared to M1 model at storey-4, M5 model at storey-5 has 84% less, M8 at storey-6 has 77% less, M3 at storey-5 has 73% less, M2 at storey5 has 64% less, M11 at storey-1 has 44% less, M10 at storey-1 has 40% less, M4 at storey-5 has 38% less and M7 at storey-4 has 10% less storey drift compared to M1 at storey-4 respectively.

**Graph-2: Displacement**

## 7. CONCLUSIONS

- The displacement of infilled frames are drastically reduced when compare to bare frames in both Hendry and Mainstone method due to its higher redundancy by the presence of diagonal strut and also in case of regular and irregular building models.
- The inter storey drift are reduced in infilled frame models as compare to bare frame models due to its higher stiffness by the presence of infills.
- The inter storey drift obtained at soft storey levels are high compare to other respective stories which shows inter storey drift is also one of the major parameter to check soft storey effect.
- The base shear obtained in masonry infill frame models are higher than bare frame models due to the presence of additional mass of infill in both Hendry and Mainstone method.

## 8. ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **Dr S Rajendra** and **Prof. VIJAY. K, Er. Kirankumar K L**, for their excellent guidance and cooperation throughout the Project.
