²Assistant Professor, Dept of Computer Science Engineering, GIMET Amritsar, Punjab, India

Abstract - Cloud computing paradigm used to provide resource on share basis to multiple machines. Due to availability of resources this mechanism becoming extremely popular for accessing resources as and when desired by machines. Reliability however the issue associated with cloud computing. Data transferred and stored over the cloud will be under siege due to the malicious access or attacks. This paper present the comprehensive survey of techniques used in order to encrypt the data and enhance reliability of cloud. Cloud reliability enhancement ensured using the encryption algorithms which are researched over the past era. Efficient parameters are extracted and qualitative comparison is presented to depict the efficient encryption mechanism that can be used in future works.

Key Words: Cloud Computing, Reliability, Encryption

1. INTRODUCTION

In today's era cloud computing becomes the hottest topic due to its ability to reduce cost associated with computing. Cloud computing provides the on demand services like storage, servers, resources etc. to the users without physically acquiring them and the payment is according to pay per use. Since cloud provides the storage, reduces managing cost and time for organization to user but security and confidentiality becomes one of biggest obstacle in front of us. The major problem with cloud environment is, the number of user is uploading their data on cloud storage so sometimes due to lack of security there may be chances of loss of confidentiality. To overcome these obstacles a third party is required to prevent data, data encryption, and integrity and control unauthorized access for data storage to the cloud. With the rapid development of hardware and software cloud computing brings the revolution in the business industry[1]. It provides resources like computational power, storage, computation platform ad applications to user on demand through internet. Some of the cloud providers are Amazon, IBM, Google, Salesforce, Microsoft etc. Cloud computing features included resource sharing, multi-tenancy, remote data storage etc. but it challenges the security system to secure, protect and process the data which is the property of the individual, enterprises and governments. Even though, there is no requirement of knowledge or expertise to control the infrastructure of clouds; it is abstract to the user. It is a service of an Internet with high scalability, quality of service, higher throughput and high computing power[2]. Cloud computing providers deploy common online business applications which are accessed from servers through web browser. Data security is the biggest issue in cloud computing and it is not easy to resolve it.

1.1 Security issues in Cloud Computing:

In cloud environment usual data transmission occurs between client and server using third party. So confidentiality of your data becomes primary problem. Security issues for a significant number of these frameworks and innovations are pertinent to distributed computing[3]. For instance, the system that interconnects the frameworks in a cloud must be secure and mapping the virtual machines to the physical machines must be completed safely. Information security includes encoding the information and additionally guaranteeing that suitable strategies are implemented for information sharing[4]. Cloud security isn't to be mistaken for "cloud-based" security benefit over the conventional danger. This security administration can be upgraded with the distributed computing, ensuring against DDOS, Trojan, Virus and Spam and so on more viably than any other time in recent memory[5].

![Fig-1: Data storage structure of Cloud Computing](image)

However, the qualities of distributed storage make clients' information looked with numerous security dangers, incorporates: (1) the conventional security district parcel is invalid. On account of the distributed storage benefit must be adaptable, security limits and assurance hardware can't be unmistakably characterized, which builds some trouble for the usage of particular assurance measures; [6, 2]the distributed storage transmits information through the system. The benefit interferences, information devastation, data stolen furthermore, altered caused by the noxious assaults in the organize represent a serious test to the security of information correspondence, getto confirmation and classification; [7, 3] from the client's view, the distributed storage of information makes distributed computing specialist co-op gets the information get to control, and the client's information is looked with protection security dangers. Individuals stress over that the touchy individual information will be exposure, abuse or
missing by putting the information in cloud condition[8]. To tackle the above issues, as of late, scientists made a parcel of research work in the information security to control systems, information respectability, confirmation, cipher text to recover and information encryption system of cloud figuring condition[9].

There are lots of security issues with cloud computing because of technologies utilization including networks, operating systems, databases, resource scheduling, virtualization, load balancing, transaction management, memory management and concurrency control. For example, the network should be secure on cloud so that mapping the virtual machines to the physical machines has to be carried out securely[10]. Data security not only involves encrypting the data but also gives surety of appropriate policies. Cloud computing suffers from some various security concerns which are given below.

- Access to Servers & Applications
- Data Transmission
- Virtual Machine Security
- Network Security
- Data Security
- Data Privacy
- Data Integrity
- Data Location
- Data Availability
- Data Segregation
- Security Policy and Compliance
- Patch management

1.2 Cloud Security Challenges:

Some of the cloud security challenges that come in front of users are given below:

I. Authentication: The data on the internet is available to all the unauthorized users. Therefore the confidentiality of the data can be lost.
II. Access Control: To give access to only legalized users some control policies are used. These services must be adjustable, well planned, and their allocation is overseeing conveniently[11].
III. Policy Integration: There are many cloud providers they use their own policies and approaches. Some of them are Amazon, Google who provides services to end users.
IV. Service Management: In this different cloud providers such as Amazon, Google, comprise together to provide services to meet their customers need.
V. Trust Management: The trust management approach must be developed so that trust remains between both parties such as user and provide.

2. BACKGROUND ANALYSIS

The cloud security is always a concern and researchers are working towards this issue to enhance security of cloud using optimal strategies. This section present the comprehensive literature survey of most efficient encryption strategies used to enhance security concerns. In [12] reviewed strategies used to enhance cloud security. Security requirements and objectives of cloud security is discussed in this literature. Accessing resources of the cloud and securely allocating it for effective utilization of cloud is suggested[12]. The problem with this literature is qualitative analysis. Parameters are not extracted and compared using this literature. In [13] proposed hybrid symmetric encryption mechanism for cloud security. Secure and protected data storage is presented using this literature. In this model, sender outsourced the data towards the destination and decryption key is hidden from the intruder. The authorization is required in order to access the key. The key is used to decrypt the data. Use of hybrid encryption makes the data more secure and less prone to attacks. In [14] proposed order preserving encryption mechanism. Differential attacks were conducted to judge the security of order preserving encryption mechanism. Estimated distribution can be calculated by the sender in order to determine the attack. The attack is limited due to encryption mechanism employed with order preserving encryption. In [15] suggested and reviewed the techniques used within cloud to ensure integrity of data stored within cloud computing. Risk and advantages associated with encryption algorithms such as RSA was analysed. Qualitative analysis of parameters is not done in this literature. In [16] proposed a data access mechanism using authorization in multi authority cloud system. Concept of update and secret key are used in order to encrypt and decrypt the information. Encryption and decryption mechanisms are securely performed by the use of secret keys. Reliability is enhanced by the application of data access mechanism. Data access mechanism distributes data access controls to the users. Users can access only that part of the cloud to which they have authority. Security and protection of data stored within the cloud is greatly enhanced using this mechanism. In [17] proposed block level encryption standards. The mechanism first of all fetches the similar blocks from the files stored within the cloud. The fetched blocks are encrypted and stored back over the cloud. The similar blocks are indexed and hence less storage requirements exist in this case. In cloud cost is encountered on the pay per use basis. Hence cost is significantly reduced. In [18] proposed query based homomorphic encryption slandered in cloud. This type of encryption performs computation on cipher text. This computation generates a encrypted result. During decryption, the generated plain text exhibits same computation as on cipher text. This encryption is one of the most secure mechanism for securing and protecting data stored within cloud computing. Related work suggest that there is a room for improvement in the security concern within cloud computing. The most secure cloud security mechanism is homomorphic encryption that can be extended by including block level redundancy handling mechanism to save space and subsequently cost associated with storage.
3. Comparison analysis of Security in Cloud Computing

This section presents comparison of techniques used to ensure security within cloud computing.

<table>
<thead>

4. CONCLUSION AND FUTURE SCOPE

Above will be the research hotspot of cloud computing not only provides the resources to the users but also give a big challenge of security. There are security requirements for both users and cloud providers but sometimes it may conflict in some way. Security of the cloud depends upon trusted computing and cryptography. In our review paper some issues related to data location, security, storage, availability and integrity. Establishing trust in the cloud security is the biggest requirement. These issues mentioned computing. The homomorphic filtering with redundancy handling mechanism can be future scope for this literature.
