Abstract - Spot Examination is a web-based application for organizing and conducting examinations using the internet. The main goal of Spot Examination is to make the process of examination fast, secure, paperless, and provides statistical analysis of results without any discrepancies. It also prevents a single user from giving multiple attempts. Spot Examination plays a key role in reducing the hectic of exam organization and conduction and increases confidentiality. It minimizes the paperwork and manual evaluation of the result. It also plays a key role in conducting remote examinations for distance education courses. Effort required to maintain and filter records of multiple users is reduced. It provides 100% accurate results removing the possibilities of any discrepancies in result evaluation or marking scheme. It allows for the automatic attendance of users. This resolves many problems of examination cells from creating and conducting the examination activities to a thorough evaluation of results by individual faculties.

Key Words: HTML, CSS, Bootstrap, JavaScript, jQuery, JSP, Servlet, MYSQL Database, Apache Tomcat Server.

1. INTRODUCTION

In today’s world, the Examination method is shifting towards online as it is considered as an easy, fast and secure method because of its reliability, speed, and accuracy. It also requires less manpower to organize and conduct examinations due to automatic evaluation and generation of results. Considering time as a major factor for conducting examinations, organizations are moving towards digital examination methods. It also allows monitoring the progress of a student. This project helped us in gaining a lot of practical knowledge. According to modern-day requirements, spot examination helps the organizations to monitor their students and keep an eye on their progress.

Spot Examination transformed the manual process of creation and evaluation into a digitally automated process. One of the main aims of the Spot examination system is to effectively evaluate the student encyclopaedical through a totally automated system that not only saves lots of time but also gives fast and accurate results along with the Graphical (pie Chart) representation.

Students can attempt tests from any location by means of the Internet, which helps the students to give the exam from far distances and also provides surety of protection and easiness and other beneficial features. Spot examination is more secure than other online examination sites by adding 2-D levels of security which is, adding the QR Validation before opening the test window as it assists the invigilator to authenticate and verify the student details. Scanning the QR code also marks the attendance/presence of students and makes the attendance process automated which in turn reduces the paper usage. We have designed our frontend using HTML, CSS, Bootstrap, JavaScript, jQuery. Backend of our project is based on JSP and Servlet. We have used Apache Tomcat as our Application Server and Apache as our Web Server with MYSQL as database.

2. LITERATURE SURVEY

Many different researches have focused on the subject of an online examination system these works can be represented as follows:

2.1 SIETTE

Guzman and Conejo (2005) proposed an online examination system called System of Intelligent Evaluation using Tests for Tele-education (SIETTE) [1]. SIETTE is a web-based environment to generate and construct adaptive tests. It can be used for instructional objectives, via combining adaptive student self-assessment test questions. SIETTE supports secure login and portability features. On the other hand, the other features: resumption capability, coding environment, test generation by file upload, and random questions distribution are missing.

2.2 EMS

Rashad Et. Al. (2010) proposed a web-based online examination system called Exam Management System (EMS) [2]. EMS manages the examination and auto-grading for students' exams and supports conducting exams, collects the answers, auto mark the submissions, and produce the reports for the test. EMS supports secure login. However, the other features: resumption capability, coding environment, test generation by file upload, and random questions distribution are missing.

2.3 CBTS

Fagbola et. al. (2013) developed a Computer Based Test System (CBTS) [3]. CBTS is a web-based online examination system developed to address issues such as Lack of timing flexibility for automation candidates log-off upon expiration of allowed time, result integrity, robustness, designed to support the examination processes and overcome challenges framing the conduct of examination, auto-marking, auto-submission, and auto-generation report of examination.
results. However, it lacked features like coding environment and test generation by file upload.

### 2.4 WETAS

Henke (2007) proposed a web-based Test, Examination and Assessment System (WETAS) [4]. WETAS is a web-based system designed for integration into existing Learning Management Systems (LMS); this system provides an examination environment and assignments as well to facilitate database supported e-Learning Test, suitable for the pre- and post- tests of Reusable Learning Objects (RLO) as well as the remote lab entry test. WETAS is implemented using Java Applet and PHP scripts for file handling. The Applet for Knowledge Testing in Laboratory Courses (AKTLC), in contribution with a task assembler, provides tasks from (a randomly selectable) text file and performs an evaluation of the student’s result, furthermore WETAS built to make new types of tasks implemented perceptively by using simple and common available text editors. It is also possible to place additional graphics inside the text of the tasks. WETAS support secure login. However, it lacks features like resumption capability, coding environment, test generation by file upload, and random questions distribution are missing.

### 2.5 SBPES

Satav et.al. (2012) proposed a Structure Query Language (SQL) Based Paperless Examination System (SBPES) [5]. SBPES is a web-based system that can present a descriptive exam format for SQL and DML statements. This application requires presenting a highly maintainable, secure platform which provides high robustness, reliable, scalable, and updatable in order to acquire new features to improve user acceptability. SBPES supports secure login. However, it lacks features like resumption capability, coding environment, test generation by file upload, and random questions distribution are missing.

### 3. PROBLEM STATEMENT

A) In the existing solutions the user is able to attempt the test from different id’s which is considered as a big flaw in the placement process as in the first attempt, the user notes down all the questions and in the next attempt gets a good score and clears the test.
B) Not all the companies and colleges have their own test portal due to which companies or the colleges conduct the test by paying for every student who appears for the test which is very expensive.
C) Some companies which have their own test portal still rely on creating the test manually which is a very hectic and time-consuming process.
D) Manual Verification of a candidate is a time consuming and a hectic process as well as requires more manpower. It can also be easily altered by unfair means.
E) Manual verification of a candidate requires a printed admit card which requires extensive use of paper.
F) Offline examination requires time for manual checking of answer sheets by the invigilator and extensive usage of paper is done.
G) In OMR based examination, each sheet has to be scanned manually which is a time-consuming process. In some cases, OMR Reader is not able to identify OMR answer sheets properly in case of some scribbling over the sheet. Also, this process is very costly.

### 4. EXISTING SOLUTION

- A) Almost all the existing solutions use a webcam for verification of the user but requires a webcam which is not available in college labs.
- B) All existing solutions conduct tests on the behalf of the company or college and charge them on per student per test basis which makes the test conduction very costly.
- C) Existing solutions do not allow college faculties to set up and conduct tests personally. Faculties have to contact the platform owner to set up tests on their behalf which makes the process very time consuming.
- D) Some Existing solutions do not prevent users from attempting a test multiple time.
- E) Existing solutions use a physical admit card for student verification which requires extensive use of paper.
- F) Maintaining Attendance of students is done manually on paper.

### 5. PROPOSED SOLUTION

#### 5.1 Multiple Attempt Prevention

This project uses a unique preassigned id associated with each user that may be an id assigned by the particular organization and cannot be changed. This gives the candidate a unique identity.

#### 5.2 Secure and Paperless

This project uses digital means to conduct and organize a test and provides a secure way of evaluation of results without any discrepancies.

#### 5.3 Complete Control on Test Conduction and Management

Teachers and faculties can set tests on their own according to their convenience without requiring any other body to set tests on their behalf which maintains confidentiality and reduces overall test setup time.

#### 5.4 Reduced Verification Time

QR Validation reduces user verification time to a few seconds and removes any discrepancies in identity of the
user attempting the test. It cannot be bypassed by any means.

5.5 No Necessity of a Physical Admit Card

QR Validation removes the need of a physical admit card to verify student details and hence helps in reducing the usage of paper.

5.6 No Time Required in Evaluation of Result

Result can be released at the instant of completion of test without wasting any time in evaluation of answer.

5.7 Automatic Attendance Monitoring

Attendance is maintained automatically with QR validation.

---

**Table -1:** Comparison between Spot Examination and Others

<table>
<thead>
<tr>
<th>Spot Examination</th>
<th>Other Websites</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Before starting the exam, verification of students will be done by scanning the QR code.</td>
<td>1) No other website, give this facility for the verification of the student.</td>
</tr>
<tr>
<td>2) Login of student is done by their college id, so that only one student will be able to give the test at a time.</td>
<td>2) Other websites generate a unique id before conducting the exam which is time-consuming.</td>
</tr>
<tr>
<td>3) Exams can be created either manually or by uploading the file containing questions.</td>
<td>3) Generally, on other websites test creation is done manually.</td>
</tr>
<tr>
<td>4) It does not provide the facility of a webcam as it is not available everywhere.</td>
<td>4) Other websites use the webcam for more preciseness.</td>
</tr>
<tr>
<td>5) We can use it either for colleges as well as for placement purposes due to its flexible nature.</td>
<td>5) It is generally made and used for placements only.</td>
</tr>
<tr>
<td>6) No such charges taken for tests every time.</td>
<td>6) They charge fees for conducting every test.</td>
</tr>
<tr>
<td>7) Attendance is maintained automatically.</td>
<td>7) Attendance has to be maintained manually.</td>
</tr>
</tbody>
</table>
7. CONCLUSION

The main benefit of this project is reducing the evaluation time as well as manpower required for invigilating the result of each individual by automating the process. It also prevents a single user from giving multiple attempts and allows for proper authentication via dynamically created unique QR code for each user.
